

# Tropical floodplain food webs - connectivity and hotspots | Final report

By Stuart Bunn, Douglas Ward, David Crook, Tim Jardine, Fernanda Adame, Neil Pettit, Michael Douglas, Dominic Valdez and Peter Kyne

THE UNIVERSITY OF  
WESTERN AUSTRALIA

National Environmental  
Research Program

NORTHERN AUSTRALIA HUB

# Acknowledgements

The authors thank Kakadu National Park Rangers and staff and Traditional Owners for access to the National Park, conveying knowledge of the region, and assistance with field work. We acknowledge the Traditional Owners of the country from which the samples were collected on the Magela Creek Floodplain. This project was funded by the NERP Northern Australia Hub, which receives major funding for its research through the Australian Government's National Environment Research Program initiative. Project funding was also provided by the Commonwealth Environmental Research Fund Significant Project scheme to the Tropical Rivers and Coastal Knowledge research hub (TRaCK).

The spread of the exotic grasses para grass (shown here) and olive hymenachne into areas of submerged aquatic plants will reduce periphyton production and primary productivity

Kakadu National Park's floodplains cover an area of approximately 20,000km<sup>2</sup>
